# **Project Report**

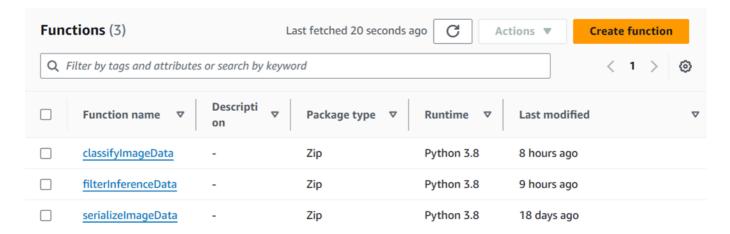

# **Project Folder Structure**

Working space:

After creating dataset, executing training job to create model, deploying endpoint and storing all output. We create 3 main **lambda functions** 

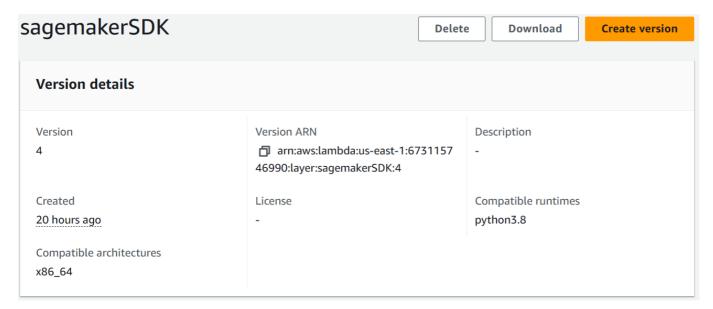

- serializeImageData
- classifyImageData
- filterInferenceData

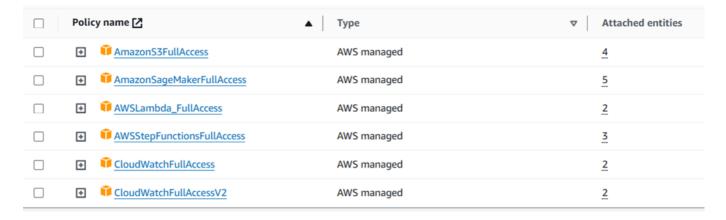

For classifyImageData, the predicting process is supposed to last longer. We set the timeout to **1 minute** (Default is 3 seconds)

We also create layer that is already installed with "sagemaker" module and attached to function classifyImageData. This allows to run Python3.8 Runtime with custom libraries.

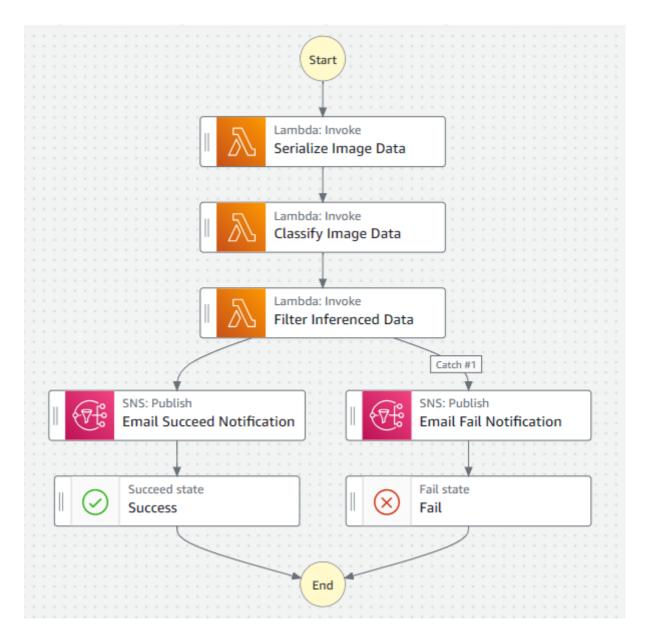

All functions we use the same role Project02-khangtictoc with necessary policy for easy deployment task.

Note: CloudWatchFullAccess and CloudWatchFullAccessV2 are for debugging lambda functions

Trust Entities:

Our **Step Function** 's diagram:

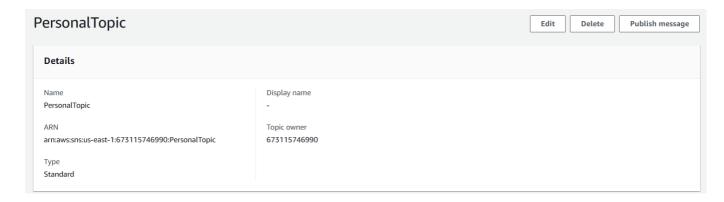

The workflow performs following tasks:

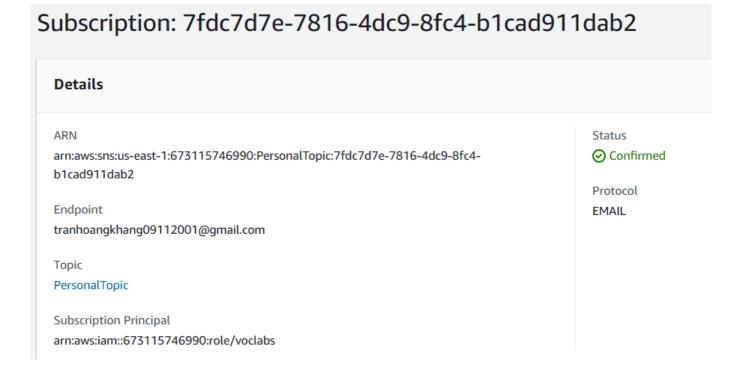

- Serialize data of input image file by base64 encoding
- Deserialize data and transfer all raw image data into deployed endpoint for inferences
- Filter and evaluate the result if they are matched defined conditions:
  - Yes => Send email notification with Successful status
  - No => Exception Handling, catching the error "States.Taskfailed " => Send email notification with Failed status => Stop the workflow

For the first state, we pass JSON payload as input as project mentioned. The next 2 states, we pass the input from the output from previous states.

For "Email Notification", we use **SNS service** to publish email message to my personal email account. Create a simple **Standard Topic**:

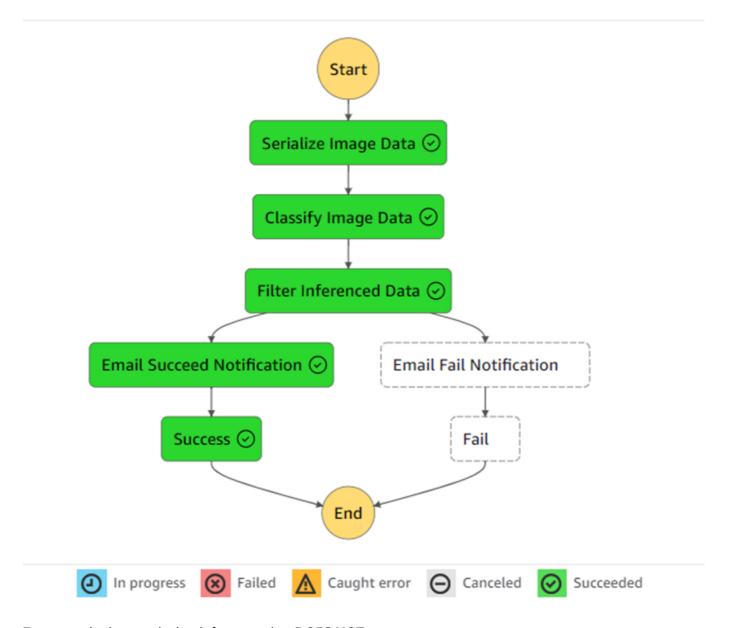

Create "Subscription" associated with above topic:

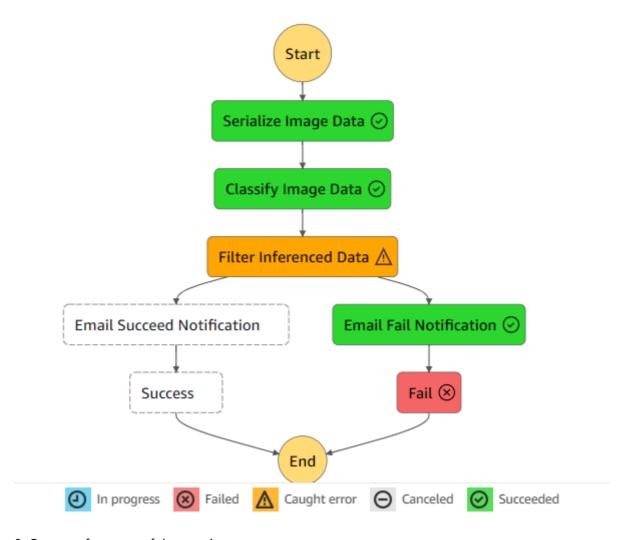

### **Result & Evaluation**

Try a sample that producing inferences that meets THRESHOLD

Try a sample that producing inferences that **DOES NOT** meets THRESHOLD

Inputs & Output of a successful execution:

Similar to each other, i.e, for state Classify Image Data
